Project C - Payments API Reference

1. Create payment

POST /v1/payments creates a payment. The request must include an Idempotency-Key header. If the same key is sent again within 24 hours, the original result is returned and no second charge is made. Body fields: amount (integer, minor units), currency (ISO 4217), payment_token and description.

2. Get payment

GET /v1/payments/{id} returns the payment status: pending, authorised, captured, failed or refunded. Only payments belonging to the tenant in the caller's token are visible.

3. Refund

POST /v1/payments/{id}/refunds creates a full or partial refund. Refunds above 10000 minor units require the refund:large scope.

4. Errors

400 invalid request. 401 missing or expired token. 403 tenant mismatch or missing scope. 409 idempotency key reused with a different body. 429 rate limit exceeded; the Retry-After header states when to retry.
