DESIGN NOTES - PROJECT C - WORKSHOP 2

Topic: payment module

1. The payment module uses idempotency keys
   to avoid duplicate charges.
2. Keys are stored for 24 hours in the
   token store, together with the response.
3. If the same key arrives with a different
   body, return HTTP 409 Conflict.
4. Settlement file is generated at 02:00 UTC.
5. Open question: should refunds reuse the
   idempotency mechanism? Decision: YES.

Attendees: Priya, Marcus, Elena
Next review: 3 weeks
